

Control systems by m-tec. The future is today

The latest generation of control systems presents ultra modern programming modules incorporating years of experience and competence in control system technologies for mixing devices. The result is a dosing, batching, and mixing control system that makes tomorrow's future possible today.

m-tec[®]
Technology for better building

Control systems by m-tec. The future has arrived

Mapping the workflow units accurately in an actual plant, the software is divided into separate modules. Adapting themselves perfectly to their workflow units, these modules can be installed either individually or in combination exactly where they are required.

In addition, the high level programming language for machine operations provides new dosing algorithms and dynamic filters for the weighing indicators.

Control systems by m-tec: Knowhow for preparing, dosing, weighing, and mixing

New dosing algorithms and dynamic filtering functions for maximum precision.

Animated process display feature on more than one monitor for precise system monitoring.

Full connectivity with client/server architecture for unrestricted data access.

Modular design for 100% flexibility.

A&C

> Additional benefits

EasyWork: Database

MIDAS stores all of the collected data in the corresponding databases where they can be retrieved for statistical analysis and production monitoring, easily and conveniently with multi-user management modules.

Any number of modules with varying permission parameters can be activated for every user in the network. **The modules can be updated separately at any time.**

Control system

The convincing attributes:

- Low-cost, standardised solution configurable to meet individual requirements
- Components available worldwide for high system availability
- Fully automated production
- Advice, hardware, software, and support from one source

EasyLife: Network

Today, pure automation focuses not only on mixing plant, but on the entire process stream, from incoming orders to billing. As a consequence **m-tec** has created MIDAS, a solution for the consistent flow of information and a valuable time saving measure.

Faults are therefore prevented, and efficiency and quality greatly boosted
